

Waterproofing Systems and Technical Solutions

Antofagasta Hospital

Currently, according to its contract, it will be the largest hospital in Chile, with 123,000 m² to be built.

The project will serve a population of 260,000 people, in addition to demand for advanced medicine from Arica to Copiapó, Chile.

The hospital will include 45 consultation cubicles, 24 emergency cubicles, 16 dental stations, 18 wards, and 671 beds. All of this will bring a considerable increase in the availability of beds in the region, as well as advanced medical equipment and hospital infrastructure. Given the hospital's high quality standards for infrastructure, LANKO products were used. Particularly, in this case, 1,483 tonnes of Self-Levelling 133 were used for the product's excellent fluidity, its great adhesive qualities, and the fact that it is quickly ready for use. It was the ideal product for such a large volume of work.
